

COURSE SYLLABUS

Course Title:	General Physics II	Date submitted:	May 2019 (AAC:19-25)
Department:	Mathematics and Science		
Curriculum:	Physics		
Course Descriptors: Make certain that the course descriptors are consistent with college and Board of Trustees policies, and the current course numbering system.	Course Code: (eg. ACC 101)	PHY*122	Prerequisites: C- or better in General Physics I (PHY*121)
	Course Type:	X	
	A: Clinical B: Lab D: Distance Learning I: Individual/Independent L: Lecture N: M: Seminar Internship P: Practicum U: Studio X: Combined Lecture/Lab Y: Combined Lecture/ Clinical/Lab Z: Combined Lecture/Studio		
	Elective Type:	G/LAS/S	Corequisites: None
	AH: Art History E: English FA: Fine Arts FL: Foreign Language G: General HI: History HU: Humanities LAS: Liberal Arts & Sciences M: Math S: Science SS: Social Science		
	Credit Hours:	4	
	Developmental: (yes/no)	No	
	Lecture:	3	
	Clinical:	0	
	Lab:	3	
Studio	0		
Contact Hours:	Other: 0		
	TOTAL: 6	Other Requirements: Scientific calculator, technology skills	
Class Maximum:	20		
Semesters Offered:	Sp		
Catalog Course Description:	Continuation of General Physics I. Topics include: principles of electricity and magnetism, including electric and magnetic fields, electric currents in magnetic fields, and electromagnetic radiation, light, optics, and selected topics in modern physics. Lecture and laboratory.		
Topical Outline: List course content in outline format.	Lecture: 1. Electricity a. Electric charge and field b. Gauss's Law c. Electrical potential d. Capacitance, electric energy storage e. Currents and resistance f. DC circuits 2. Magnetism a. Magnetism and magnetic fields b. Electromagnet induction and Faraday's Law		

- c. AC Circuits
 - d. Maxwell's Equation
 - 3. Light
 - a. Reflection and refraction
 - b. Lenses and optical instruments
 - c. Light waves, interference, diffraction and polarization
 - 4. Modern Physics
 - a. Relativity, time dilation, length contraction, four-dimensional space-time, relation of mass and energy
 - b. Quantum theory and atomic models, including work by Planck, Bohr, Schrödinger and de Broglie
- Laboratory:
- 1. Measurement of Resistance
 - 2. Ohm's Law: Resistances in Series and Parallel
 - 3. DC Currents
 - 4. RC Time Constant
 - 5. Introduction to the Oscilloscope
 - 6. Multiloop Circuits: Kirchhoff's Rules
 - 7. Electromagnetic Induction
 - 8. Reflection and Refraction
 - 9. Mirrors and Lenses
 - 10. Polarized Light
 - 11. Prism Spectrophotometer
 - 12. Line Spectra Rydberg Constant
 - 13. Detection of Nuclear Radiation: Geiger Counter
 - 14. Radioactive Half-Life
 - 15. Absorption of Nuclear Radiation

Outcomes:

Describe measurable skills or knowledge that students should be able to demonstrate as evidence that they have mastered the course content.

Upon successful completion of this course, the student will be able to do the following:

- 1. solve elementary problems dealing with Coulomb's Law for electrostatic charges and for magnetic properties of materials
- 2. calculate electric field distributions via Gauss' Law and magnetic field distributions via Ampere's Law
- 3. given information on the current, voltage and resistance of electrical circuits, compute the circuital parameters of elements in a DC circuit, and to carry out controlled experiments verifying the results of the calculations
- 4. discuss the properties of electromagnetic radiation with regard to type, wavelength, and velocity of propagation
- 5. explain, with examples, the relationship between the properties of waves, such as, wavelength, frequency and velocity of propagation
- 6. solve elementary problems and perform controlled experiments involving diffraction and interference of light
- 7. apply the properties of reflection and refraction of light to the analysis of optical systems involving lenses and mirrors
- 8. distinguish between the major periods of the development of physics referred to as the periods of Classical Physics, Modern Physics, and Contemporary Physics
- 9. describe the general tenets of Einstein's special theory of relativity, time dilation and the relationship between energy and mass
- 10. explain the Bohr-Rutherford model of the atom as it applied to the atomic spectra emitted by the hydrogen atom and subsequent quantum models developed by Schrödinger

PROGRAM: (Numbering reflects Program Outcomes as they appear in the college catalog)

N/A

	<p>COMPETENCY FULFILLED: Scientific Knowledge & Understanding (SCKX) OR Scientific Reasoning (SCRX)</p>
<p>Evaluation: List how the above outcomes will be assessed.</p>	<p>Assessment will be based on the following criteria: Written examinations Quizzes Observation of laboratory work Laboratory reports</p>
<p>Instructional Resources: List library (e.g. books, journals, on-line resources), technological (e.g. Smartboard, software), and other resources (e.g. equipment, supplies, facilities) required and desired to teach this course.</p>	<p>Required: Scientific calculator, physics software, physics laboratory Desired:</p>
<p>Textbook(s)</p>	<p>Giancoli, <i>Physics</i>, 6th ed.; Pearson Education Wilson, <i>Physics Laboratory Experiments</i>, 6th ed.; Houghton Mifflin</p>
